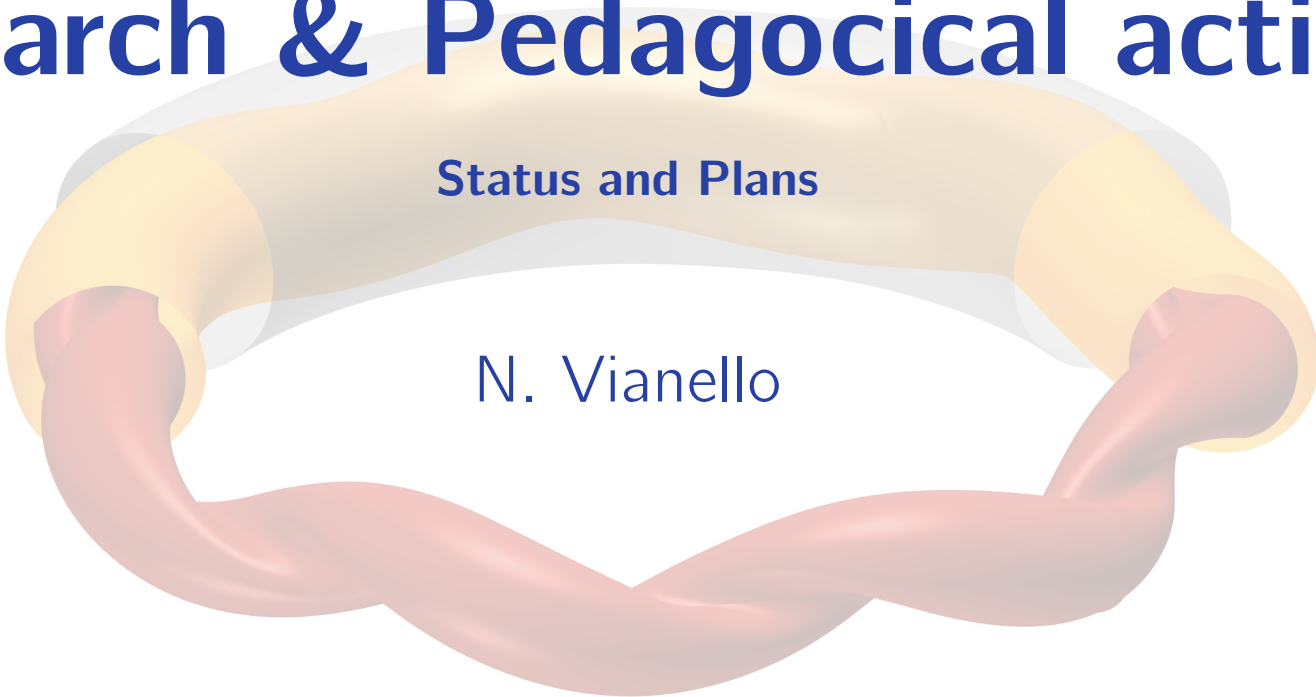
Research & Pedagocical activity

Status and Plans



N. Vianello

Personal research interest

- The candidate has been active in fusion plasma physics since the M.Sci. thesis in 1999
- Personal research interests can be described in three main macro-areas
  - (A) Turbulence & Flows in magnetized plasmas
  - (B) Statistical characterization of electromagnetic fluctuations
  - (C) Emerging of electromagnetic structures
  - (D) Spontaneously developed Helical plasmas

Turbulence & Flows

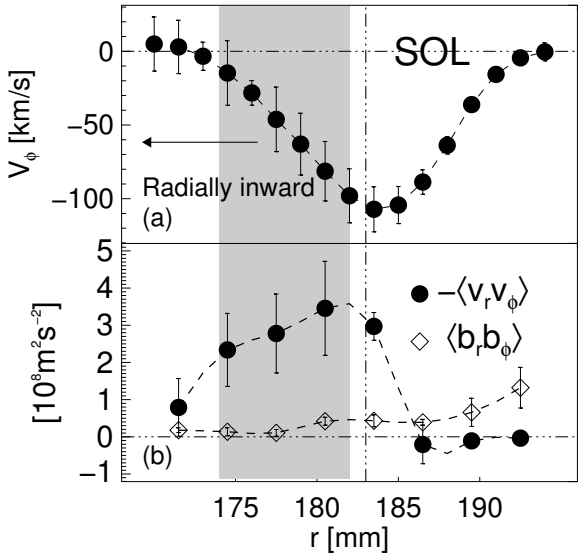
A

- The principal results may be summarized as follows:

Turbulence & Flows

- The principal results may be summarized as follows:

(i) Role of electrostatic Reynolds stress in momentum generation in RFPs

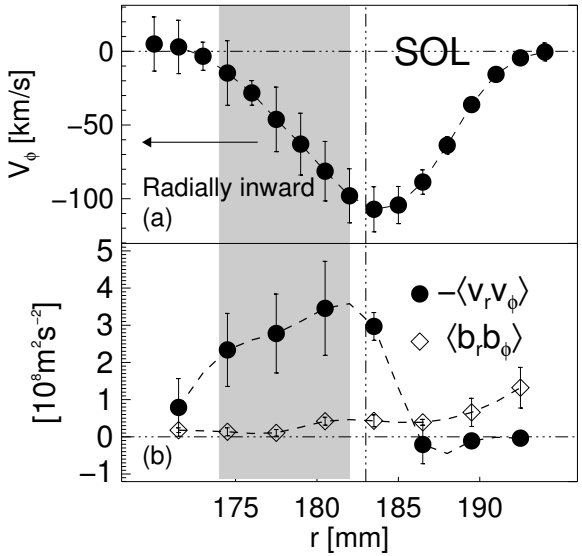


PRL 94 p. 135001, NF 45 p. 761, PPCF 48 p. S193

Turbulence & Flows

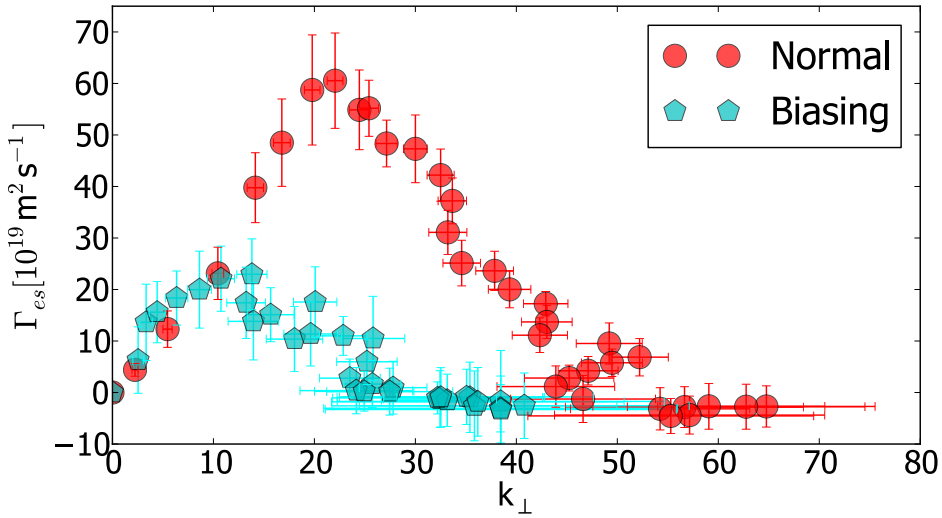
- The principal results may be summarized as follows:

(i) Role of electrostatic Reynolds stress in momentum generation in RFPs



PRL 94 p. 135001, NF 45 p. 761, PPCF 48 p. S193

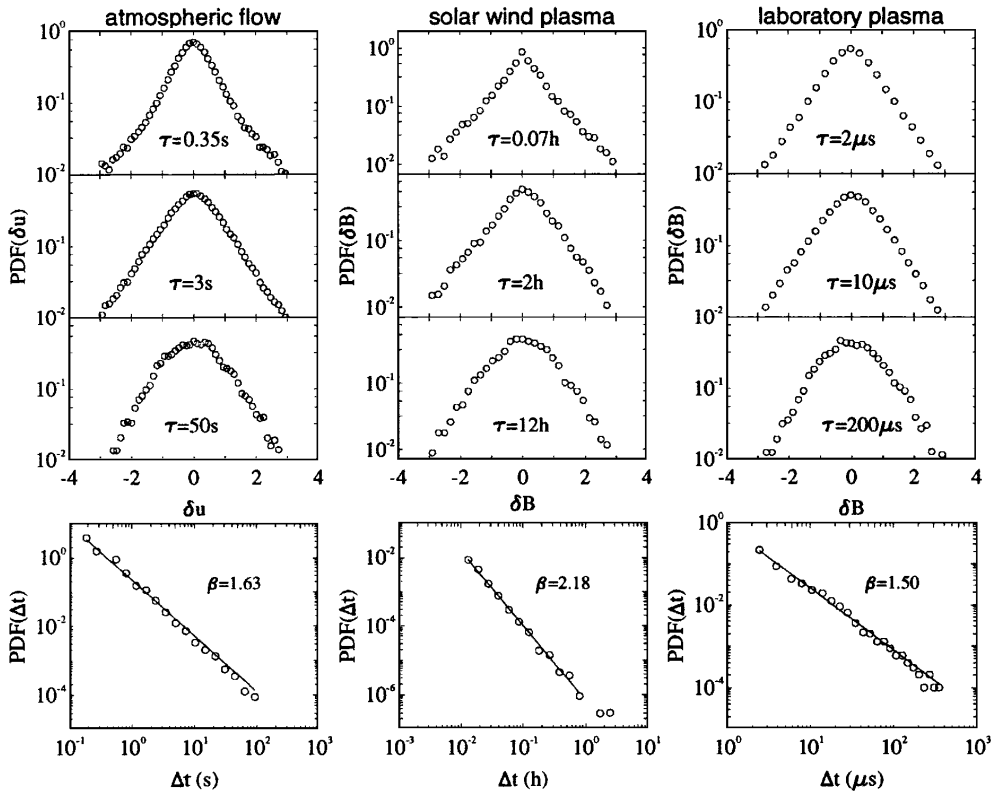
(ii) Transport reduction induced by active modification of sheared flow



PPCF 42, p. 83

Intermittency & SOC

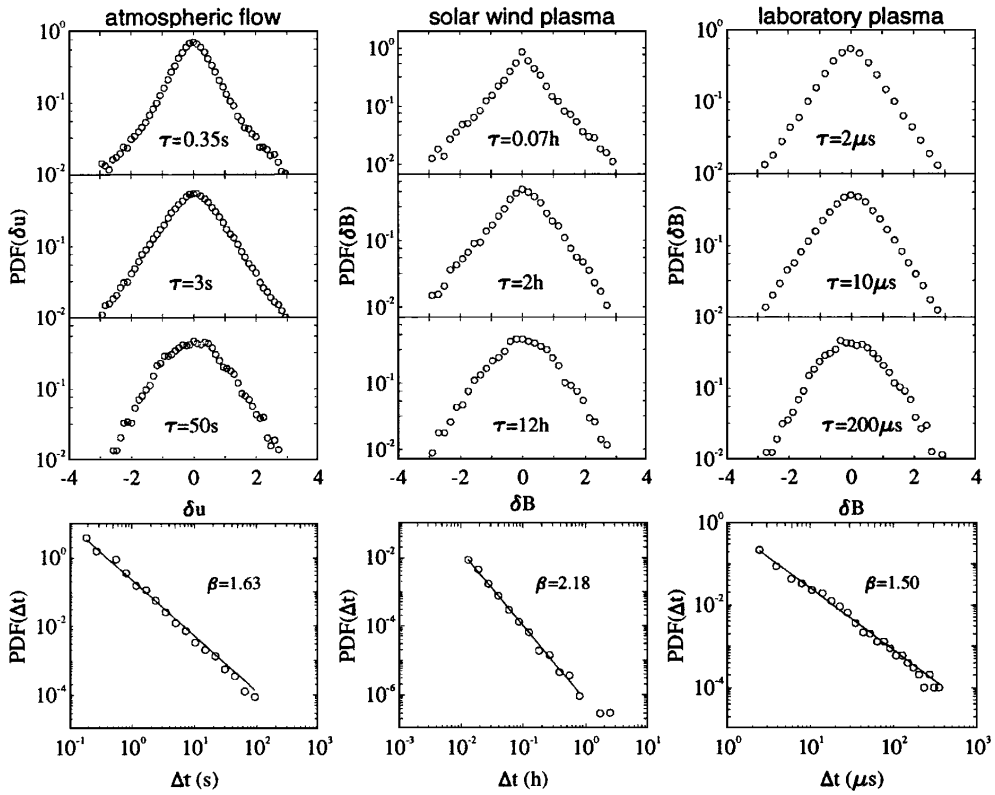
- The presence of Intermittency, as lack of self-similarity, revealed in laboratory plasmas, in analogy to solar wind turbulence and ordinary flow



EPL 54 p.51, PRL 87 p.045001, PPCF 2002 pp 2513, EPL 58, pp 349

Intermittency & SOC

- The presence of Intermittency, as lack of self-similarity, revealed in laboratory plasmas, in analogy to solar wind turbulence and ordinary flow



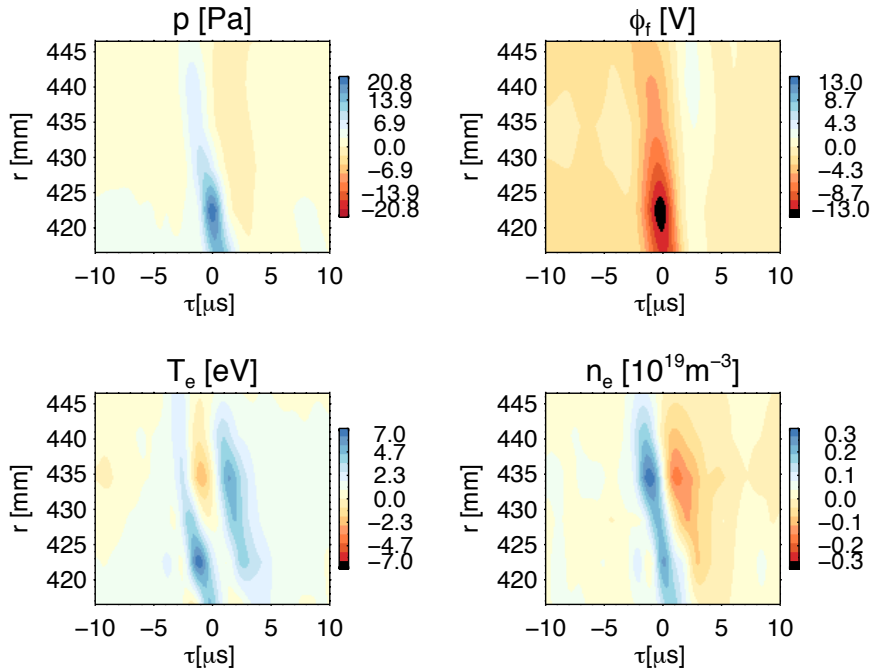
EPL 54 p.51, PRL 87 p.045001, PPCF 2002 pp 2513, EPL 58, pp 349

- Inconsistency with SOC model revealed PRL 86 pp 3032, EPL 58 pp 349, PRL 87 045001

Coherent structures characterization

C

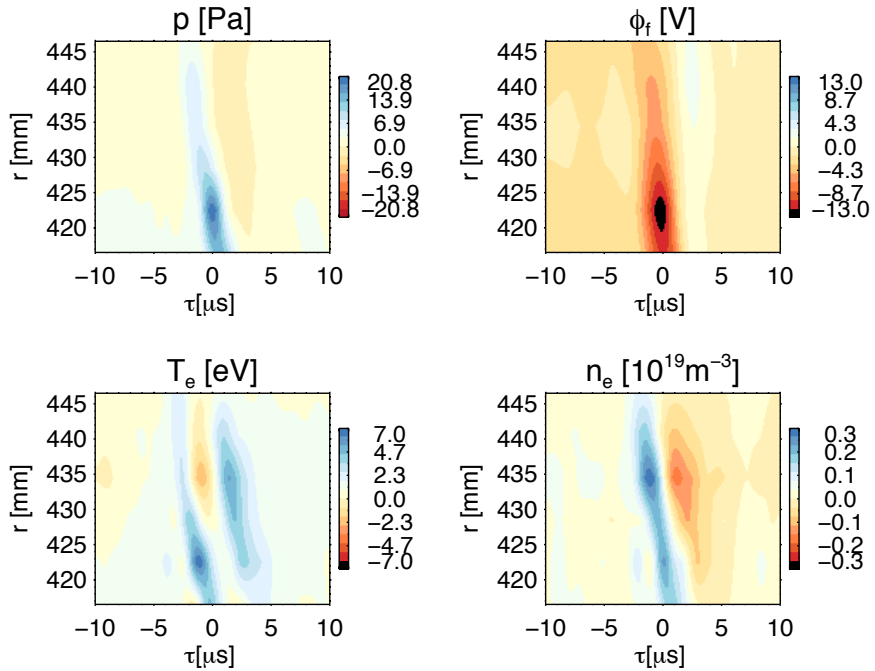
- Complete characterization of coherent structures responsible for intermittency

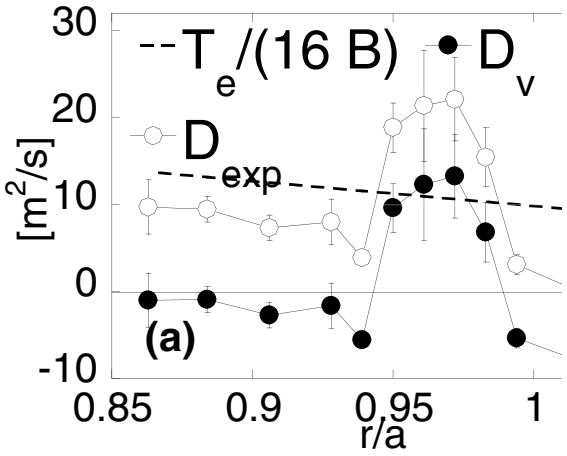


Coherent structures characterization

C

- Complete characterization of coherent structures responsible for intermittency
- Evaluation of transport contribution due to coherent structures

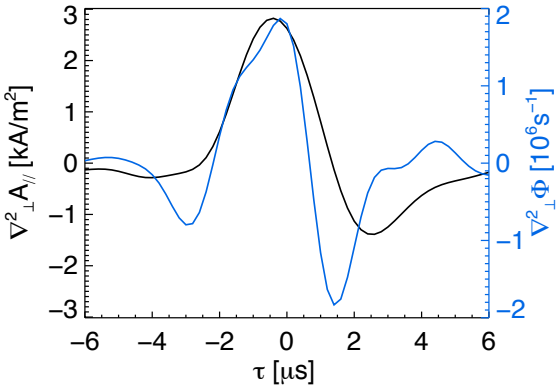


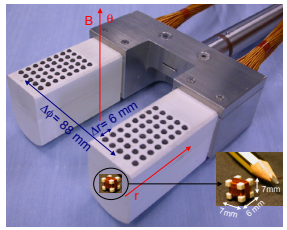


PRL 93 p.215003, PoP 9 p.4110

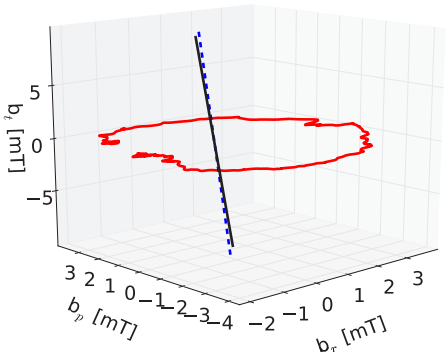
Current filaments

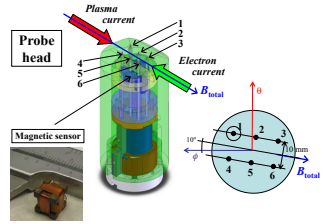
- Measurements of parallel plasma current associated to *blobs* & *filaments* in different experiments



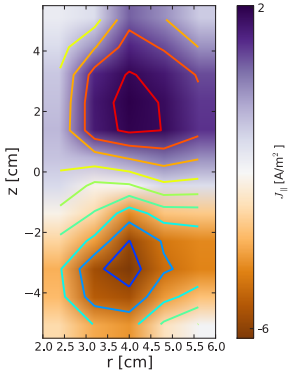


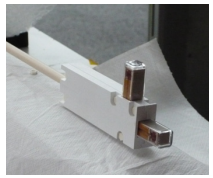
RFX-mod Reversed Field Pinch





ASDEX-Upgrade Tokamak





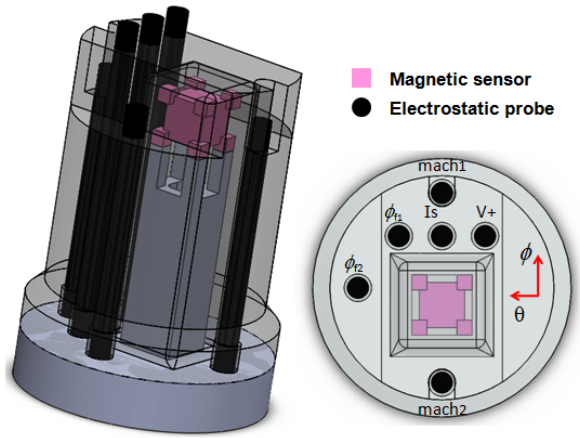
TORPEX SMP

- Parallel current measured for Drift-Kinetic Alfvén vortices in RFX-mod (PRL 102 p 165001, NF 50 p.042002), type I ELMs filaments in ASDEX-Upgrade (PRL 106 p 125002), interchange-induced blobs in TORPEX (CRPP) (PRL 106 p 245001)

Current filaments

- Collaboration established to extend studies of current filaments to other devices, namely TJ-II stellarator, with a probe which combines vorticity and current measurements and EAST tokamak for the studies of ELMs

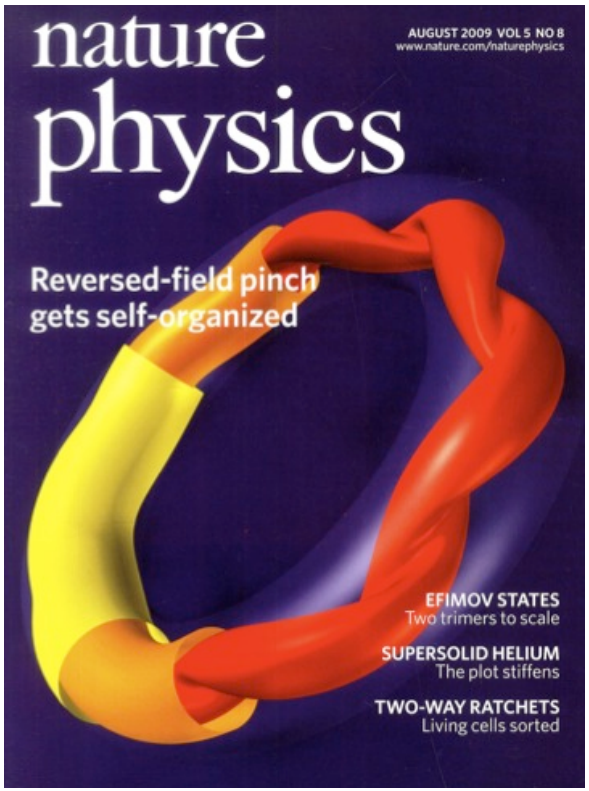
TJ-II Stellarator



EAST-Tokamak

- Coordination of EFDA working group on 3D field effects in edge and SOL and diagnostic development under EFDA Transport Topical Group for 2011

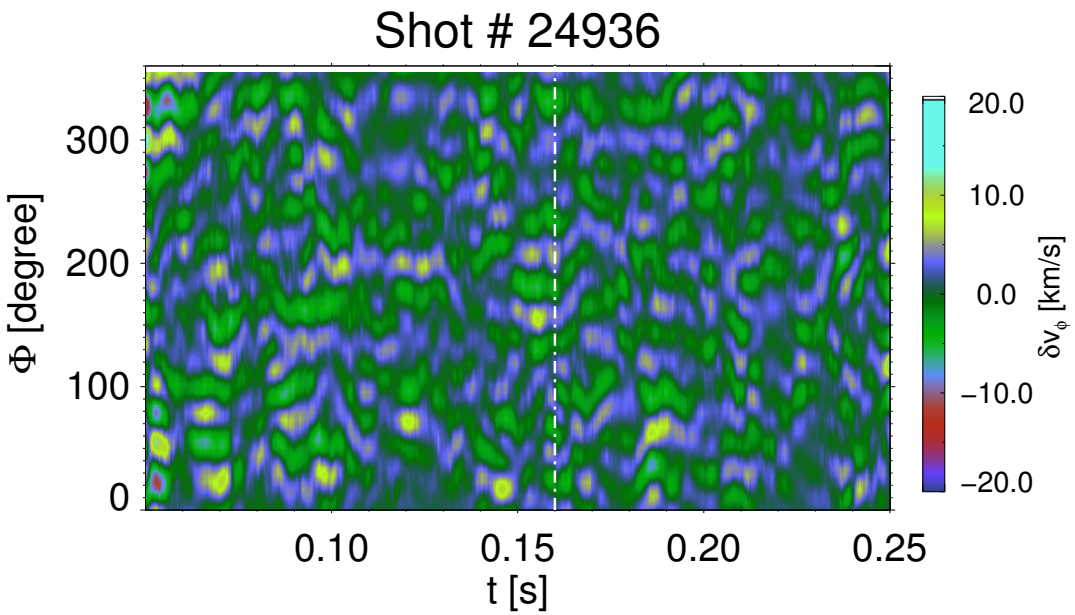
Helical plasmas



- Observation and characterization of spontaneous helical plasmas developing in high current Reversed Field Pinch operation

  Nat. Phys. 5 pp. 570

Helical plasmas



- Small residual helical ripple influence on edge physics
- Helical flow associated to dominant mode
- Relationship between magnetic topology and flow also in the framework of high density radiative collapse

PPCF 52, pp 095011, CPP 50 pp. 824, NF 51, 073002

Pedagogical experience

- Assistant for the course `Fluid and Plasma physics` with lessons on `Tangential stress in a newtonian fluid` and exercise on fluid dynamics
- Supervising of 2 Bachelor Thesis and 1 Ms.Sci. Thesis on Plasma physics. Addressed the following thematic:
  (a) BA.: Modification of spectral properties of fluctuations as a function of plasma equilibria in a Reversed Field Pinch. Role on the emphasis of $m = 0$ islands
  (b) BA: The role of toroidal flow in the high density regimes of an RFP plasma. Relation between flow and topology
  (c) M.Sci: Comparison between filamentary structures in a Reversed Field Pinch and a Tokamak

Planned research activity

3D effects on flow and transport: 3D effects are present in almost all the present experiment and foreseen for future one. The role of 3D magnetic field on flow, both in the external region where stochastic layer can be created, and in the core are fundamental topic to be addressed and considered

Fast ions: MHD and turbulence modification of fast ion population is a subject to be investigated for future machines. Experimentally, small devices may be thought as test bed if equipped with tools for fast ion injections (Beam or ion sources), or if available spontaneous population (reconnecting processes)

Spontaneous magnetic reconnection: Interdisciplinary subject where collaboration with space and astrophysical plasma may be considered

Planned pedagogical activity

Multidisciplinary approach to data analysis: A lot of techniques, used in different research area (e.g. space plasma, signal and image processing etc.), may be applied to fusion plasma data

Small fusion device as learning tools: The use of smaller device, eventually with cold plasmas may offer the opportunity for students for a comprehensive approach to the data, from the diagnostic through the acquisition up to the analysis
